

Task 3.6: Summarizing & Cleaning Data in SQL

Directions

Rockbuster's database engineers have loaded some new data into the database, and your manager has asked you to clean and profile it. Follow the instructions below to complete their request:

1. **Check for and clean dirty data:** Find out if the film table and the customer table contain any dirty data, specifically non-uniform or duplicate data, or missing values. Create a new "Answers 3.6" document and copy-paste your queries into it. Next to each query write 2 to 3 sentences explaining how you would clean the data (even if the data is not dirty).

a) Checking for duplicate value from the film table

The screenshot shows the pgAdmin 4 interface. The left sidebar displays the database structure: Servers (1) > PostgreSQL 14 > Databases (2) > Rockbuster > postgres. The main window is titled 'Rockbuster/postgres@PostgreSQL 14 *'. The 'Query Editor' tab is active, showing the following SQL query:

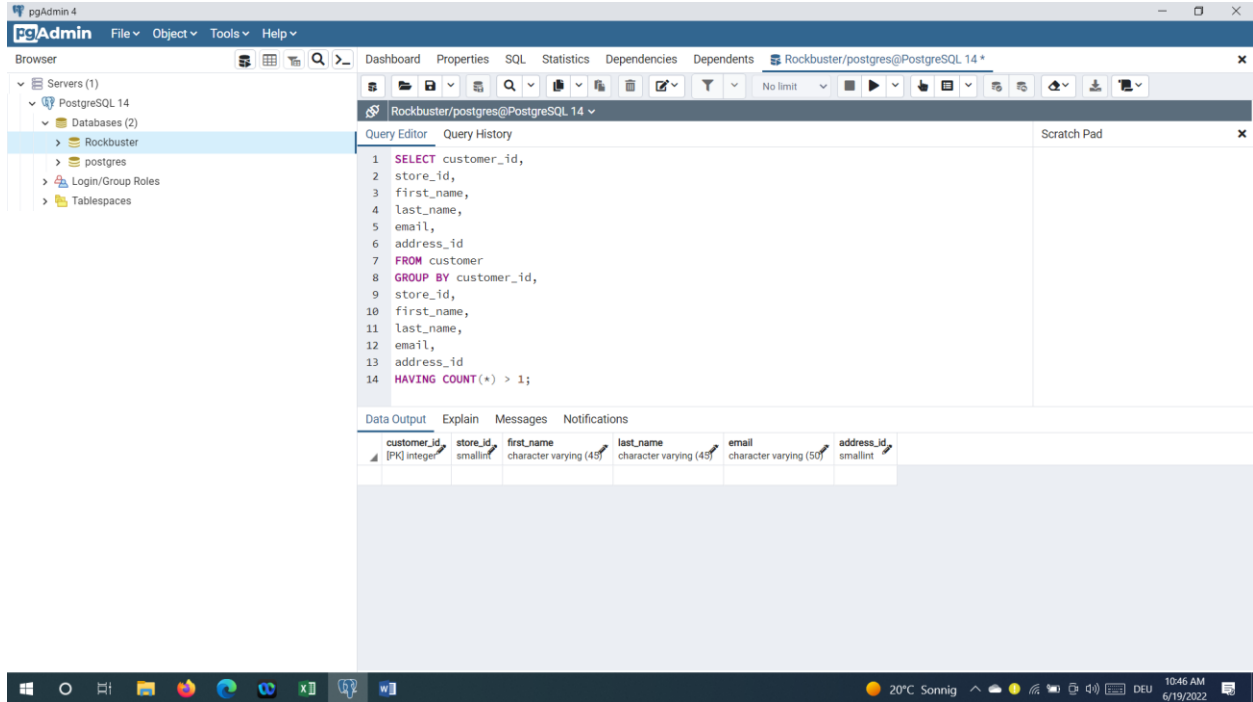

```
1 SELECT film_id,
2 title,
3 description,
4 release_year,
5 language_id,
6 rental_duration,
7 rental_rate,
8 length,
9 replacement_cost,
10 rating,
11 COUNT(*)
12 FROM film
13 GROUP BY film_id,
14 title,
15 description,
16 release_year,
17 language_id,
18 rental_duration,
19 rental_rate,
20 length,
21 replacement_cost,
22 rating
23 HAVING COUNT(*) > 1;
24
```

Below the query editor, the 'Data Output' tab is active, showing a table with the following columns and data types:

film_id	title	description	release_year	language_id	rental_duration	rental_rate	length	rating	count
[PK] integer	character varying (255)	text	integer	smallint	smallint	numeric (4,2)	smallint	numeric (5,2)	bigint

The Windows taskbar at the bottom shows the system clock as 10:38 AM on 6/19/2022, with a temperature of 20°C and the word 'Sonntag'.

b) Checking for duplicate value from the customer table

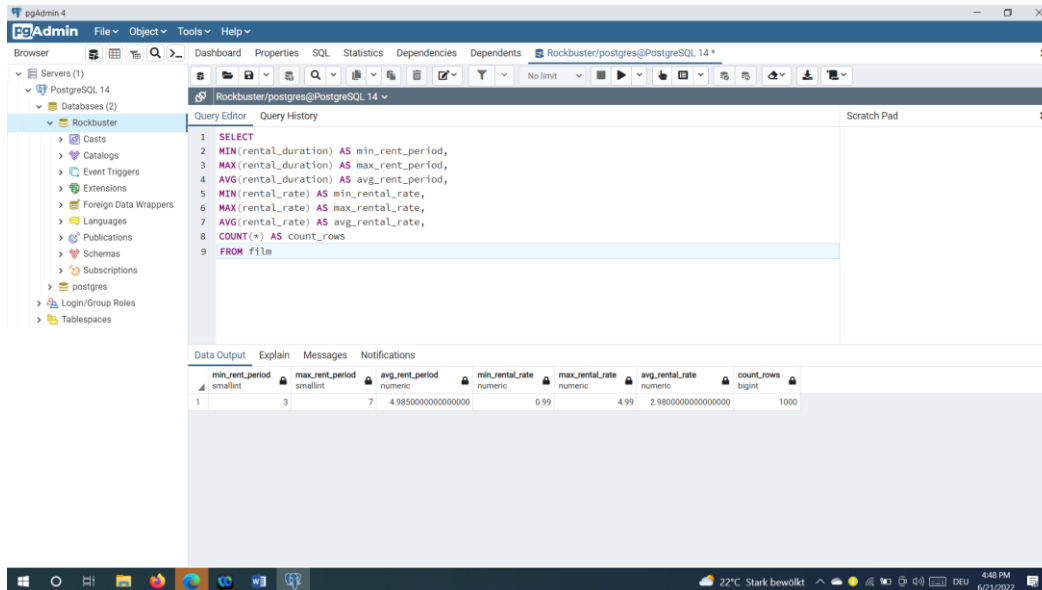

There are no duplicates in the above made tables. In case that there were any, I can:

- Create a virtual table, known as a “view,” where you select only unique records.
- Delete the duplicate record from the table or view

2. **Summarize your data:** Use SQL to calculate descriptive statistics for both the film table and the customer table. For numerical columns, this means finding the minimum, maximum, and average values. For non-numerical columns, calculate the mode value. Copy-paste your SQL queries and their outputs into your answers document.

a) Summary for numeric columns in film table

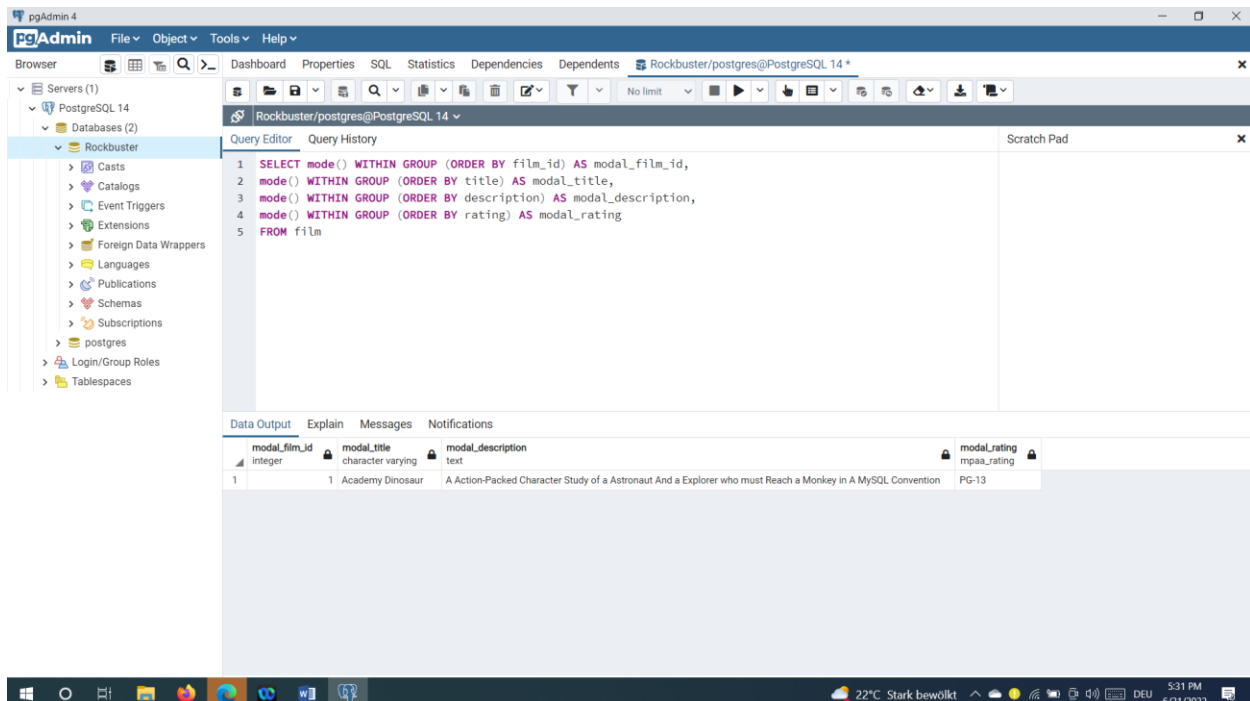

The screenshot shows the pgAdmin 4 interface. The Query Editor contains the following SQL query:

```
1 SELECT
2 MIN(rental_duration) AS min_rent_period,
3 MAX(rental_duration) AS max_rent_period,
4 AVG(rental_duration) AS avg_rent_period,
5 MIN(rental_rate) AS min_rental_rate,
6 MAX(rental_rate) AS max_rental_rate,
7 AVG(rental_rate) AS avg_rental_rate,
8 COUNT(*) AS count_rows
9 FROM film
```

The Data Output tab shows the results of the query:

	min_rent_period	max_rent_period	avg_rent_period	min_rental_rate	max_rental_rate	avg_rental_rate	count_rows
	smallint	smallint	numeric	numeric	numeric	numeric	bigint
1	3	7	4.9850000000000000	0.99	4.99	2.9800000000000000	1000

b) Summary for numeric columns in film table

The screenshot shows the pgAdmin 4 interface. The Query Editor contains the following SQL query:

```
1 SELECT mode() WITHIN GROUP (ORDER BY film_id) AS modal_film_id,
2 mode() WITHIN GROUP (ORDER BY title) AS modal_title,
3 mode() WITHIN GROUP (ORDER BY description) AS modal_description,
4 mode() WITHIN GROUP (ORDER BY rating) AS modal_rating
5 FROM film
```

The Data Output tab shows the results of the query:

	modal_film_id	modal_title	modal_description	modal_rating
	integer	character varying	text	mpaa_rating
1	1	Academy Dinosaur	A Action-Packed Character Study of a Astronaut and a Explorer who must Reach a Monkey in A MySQL Convention	PG-13

c) Summary for numeric columns in customer table

The screenshot shows the pgAdmin 4 interface. The left sidebar displays the database structure, with 'Rockbuster' selected under 'Databases (2)'. The 'Query Editor' tab is active, showing a SQL query that calculates summary statistics for numeric columns in the 'customer' table. The 'Data Output' tab shows the results of the query.

```
1 SELECT
2 MIN(customer_id) AS min_customer_id,
3 MAX(customer_id) AS max_customer_id,
4 AVG(customer_id) AS avg_customer_id,
5 MIN(store_id) AS min_store_id,
6 MAX(store_id) AS max_store_id,
7 AVG(store_id) AS avg_store_id,
8 MIN(address_id) AS min_address_id,
9 MAX(address_id) AS max_address_id,
10 AVG(address_id) AS avg_address_id,
11 COUNT(*)
12 FROM customer;
```

min_customer_id	max_customer_id	avg_customer_id	min_store_id	max_store_id	avg_store_id	min_address_id	max_address_id	avg_address_id	count
1	1	599	300.00000000000000000000	1	2	1.4557595993322204	5	605	304.7245409015025042

d) Summary for non-numeric columns in customer table

The screenshot shows the pgAdmin 4 interface. The left sidebar displays the database structure, with 'Rockbuster' selected under 'Databases (2)'. The 'Query Editor' tab is active, showing a SQL query that calculates summary statistics for non-numeric columns in the 'customer' table. The 'Data Output' tab shows the results of the query.

```
1 SELECT mode() WITHIN GROUP (ORDER BY first_name) AS modal_first_name,
2 mode() WITHIN GROUP (ORDER BY last_name) AS modal_last_name,
3 mode() WITHIN GROUP (ORDER BY email) AS modal_email,
4 COUNT(*) AS count_rows
5 FROM customer;
```

modal_first_name	modal_last_name	modal_email	count_rows
Jamie	Abney	aaron.selby@sakilacustomer.org	599

3. Reflect on your work: Back in Achievement 1 you learned about data profiling in Excel. Based on your previous experience, which tool (Excel or SQL) do you think is more effective for data profiling, and why? Consider their respective functions, ease of use, and speed. Write a short paragraph in the running document that you have started.

Excel is a good tool in analyzing the smaller size of the data. On the other side SQL is more efficient and faster when it comes working with the bigger size of the data.
